

Off Site Backup

We have partnered with The Planet, the number one privately held dedicated server hosting facility in the world to deliver superior off site backup technology to your business. The Planet is also the most secure non-military data storage facility in the world and provides secure storage for all of our clients off site backup data.

Why use off site backup? With traditional backup tapes statistically having nearly a 50% failure rate between user error and physical failure the next best alternative is backup using hard drives. The problem with hard drives is that they must be plugged in all of the time like the computers, which makes them susceptible to lightning/surge failure, physical failure, and failure due to natural disaster.

While the speed of using hard drives cannot be beat, an off site backup eliminates the chances of simultaneous physical failure due to lightning/surge failure, physical failure, and failure due to natural disaster.

Our off site backup service goes one up on our competition by being backed up to two geographically separate locations on different backup servers. This strategy combined with The Planet's 100% network up time means that when you have a disaster and need your data back right now, you can get it back without issue. That's piece of mind your business can't live with out. Best of all, your off site backup is included with your monthly service agreement!
